Abstract of JP55010584

PURPOSE To secure a quick and simple measurement of the substrate density as well as to ensure the continuous and repetitive use of the enzyme electrode by securing the double-lamination structure and thus giving the electrochemical activity to the substrate which suffers the peculiar catalyst function of the enzyme. CONSTITUTION The electron conducting material such as the graphite powder is well mixed with the insoluble redox compound like chloranti. Then the existendructure like glucose existase is fixed to such multure via the bridging reagent like glutaria aldehyde. The dalsyer 2 composed of a small amount of the mixture of the electron conducting material, the insoluble redox compound and the fixed enzyme is unified with sits layer 1 composed of the electron conducting material through the press formation and other methods. In such way, the enzyme electrode can be made of the minimum necessary amount of enzyme and the insoluble redox compound.
